Motivation

Intervention actions
Documentation ?

Establish a detailed baseline to asses Pre- & Post- intervention / restoration actions

A baseline for long-term monitoring of river processes

River assessment- methodology & context

Variety of indices e.g.,

- River Habitat Survey (RHS; UK)
- National Physical Habitat Index (Denmark)...
- Rapid Assessment Protocols For Use in Streams & Wadeable Rivers (USA)

- Rapid Assessment Protocol

- Morphological Quality Index (MQI; Rinaldi et al, 2013)

Environ Earth Sci (2017) 76:99

ORIGINAL ARTICLE

Diversification of the hydromorphological state and the quality of streams in the Negev Desert (Israel)

Małgorzata Kiliowska-Struska¹ · Lukasz Wieliczka² · Jolita Łekach³ ·

Environ Earth Sci (2017) 76:99

Table 2 Hydromorphological state of the studied sections of the selected Negev Desert streams (%)

Elements	Streams		
	Nahal Sansana	Nahal Yatir	Nahal Hatira
<i>Bank material</i>			
Soil	100	100	
Bedrocks			5
Concrete			
Sand			
<i>Bank modification</i>			
None	100		
Reinforced			
Resectioned			
<i>Natural bank features</i>			
None		95	90
Eroding cliff		60	10
Unvegetated side		5	
Vegetated side		5	
<i>Channel substrate</i>			
Bedrock		10	10
Silt	70		
Gravel	30	90	20
Sand			70
Concrete			

Intensive vs. Extensive

Inbar, 2008

MQI

- Comply with WFD
- Focus on River-Geomorphology
- Applied to a range of environments
- Consider human alteration of river
- Riparian habitat assessment
- Does not aim to cover hydrobiology
- Does not look @ water quality

Segment										
1	2	3	4	5	6	7	8	9	10	11
0	5	5	0	5	0	3	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0
F2 - presence of modern floodplain										
F3: Hillslope – river corridor connectivity										
F4- presence of bank retreat										
F5- presence of potentially erodible corridor										
F6: Bed configuration-valley slope										
Morphology										
F7- planform pattern										
F8- presence of typical fluvial landforms in the floodplain										
Cross-section configuration										
F9- variability of cross-section										
F10- structure of the channel bed										
F11- presence of in-channel large										

ND = Not Detectable due to small streams

NA= Not Applicable to unconfined or partly confined streams

stot = sum of scores

smax = maximum possible based on category C= 124

Rating Criteria:

0 <MQI<0.3: very poor; 0.3 <MQI<0.5: poor; 0.5 <MQI<0.7: moderate; 0.7 <MQI<0.85: good; 0.85 <MQI<1.0: very good

MQI

- Does it work in the case of Mediterranean Streams?
- Does it work in the case of long-term & intensive anthropogenic impact

CAN RAPID ASSESSMENT PROTOCOLS BE USED TO JUDGE SEDIMENT IMPAIRMENT IN GRAVEL-BED STREAMS? A COMMENTARY¹

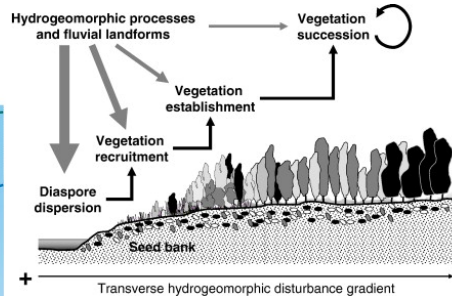

Thomas E. Lisle, John M. Buffington, Peter R. Wilcock, and Kristin Bunte²

Human Cause	Natural Causes	Geomorphic Response	Channel Change
Logging, roads, urban development, vegetation conversion, grazing, off-road vehicles (ORVs) dam removal, climate change	Wildfire, landslides, debris flows, large floods, channel migration	Increased total sediment input Increased fine sediment input Decreased flow Channel widening Armor layer disturbance	Finer surface grain size
Water diversion, climate change Grazing, ORV traffic Gravel mining, ORV traffic, suction dredging, grading Impoundments, grade control structures Habitat structures, logging slash	Forest growth, stream capture Meander migration Intensive salmon spawning Log jams, tributary debris, landslide deposits Woody debris	Deposition from backwater effects Increased form roughness	
Dams, watershed rehabilitation, gravel mining Gravel vegetation, hillside disturbance Transbasin diversion, flow releases Stream channeling, channelization	Watershed recovery, debris flows, log jams Debris flows, landslides, tributary inputs Large runoff events Scour by large floods	Decreased sediment input Inputs of coarse sediment Increased flow Decreased form roughness	Coarser surface grain size
Causes for increased sediment input (see above) Grazing, decortication of riparian vegetation Logging, development, roads, channelization, climate change	Causes for increased sediment input (see above) Succession from seed to forest, increased meandering Wildfire, large floods, change in flow regime	Increased sediment input Weakening banks Increased peak flow	Channel widening
Causes for decreased sediment input (see above), stream channeling Disturbance of fine-grained soils and bedrock Peak flow reduction below dams, (fine-sediment inputs (see cause above)) Grazing, impacts leading to increased runoff, removal of large wood from channels	Causes for decreased sediment input (see above), scour of wood Volcanic ash eruptions Fine-sediment inputs (see cause above), reduced peak flows through landscapes with fine-grained, cohesive sediments	Channel incision from decreased sediment input or roughness Increased suspended sediment to build banks Riparian encroachment Gullying	Channel narrowing
Channelization, stream channeling Causes for increased sediment input (see above) Grazing, removal of woody riparian vegetation, destruction of riparian vegetation by water withdrawal	Debris flows and floods Causes for increased sediment input (see above) Bank erosion by floods, natural loss of riparian vegetation	Loss of scour elements Increased sediment input Channel widening	Decreased pool frequency and/or volume
Habitat structures, logging debris, blowdowns of riparian buffers Causes for decreased sediment input (see above) Suction dredging	Wood inputs, debris flows and landslides Causes for decreased sediment input (see above)	Gain in scour elements Decreased sediment input Direct effects	Increased pool frequency and/or volume

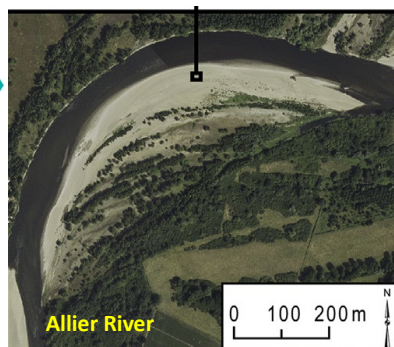

Contextual Approach

Church, 1992 in Robert, 2003

Corenblit et al., 2007

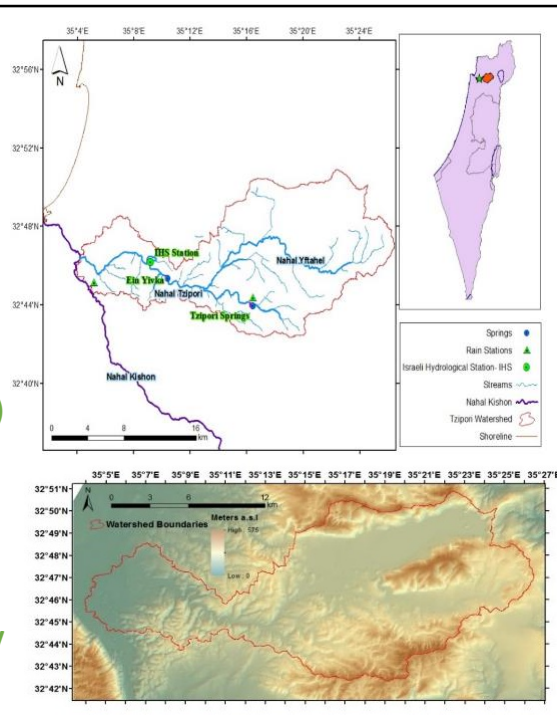

Allier River

Hortobagyi et al., 2017

Nachal Tzipori

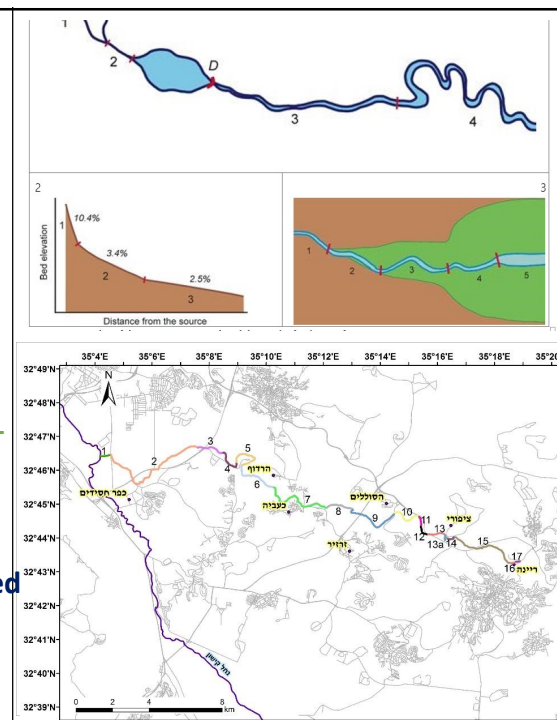

- **Drainage area: 293 km²**
- **Mediterranean climate**
- **Mean annual rain depth: ~550mm**
- **Main stream: 32 km**
- **Main tributary-
Nachal Yiftachel**
- **Several springs (2-3 M m³)
Ein Yivka, Einot Tzipori,
Einot Yiftachel**
- **River restoration projects**
- **Public recreational use by
1 million people**

MQI - Parameters

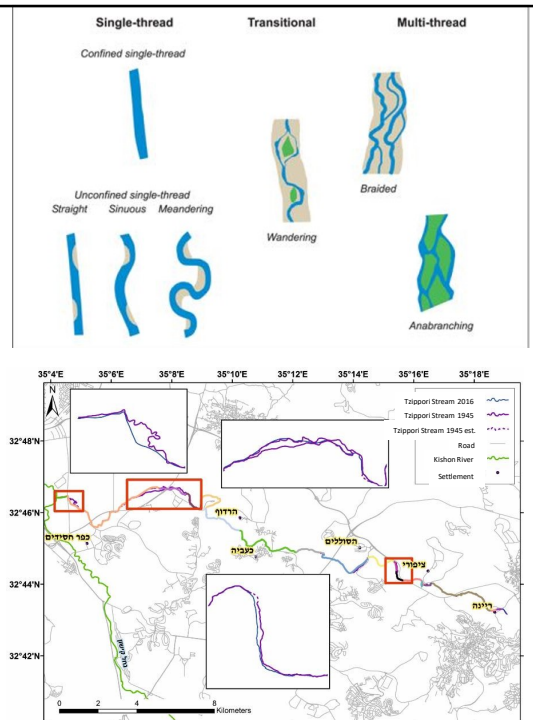

A total of 17 river Segments based on:

- **River longitudinal profile**
- **Changes in river -
width & size**
- **Hydrological Discontinues-
dams, reservoirs,
infrastructure**
- **176 Cross sections collected**

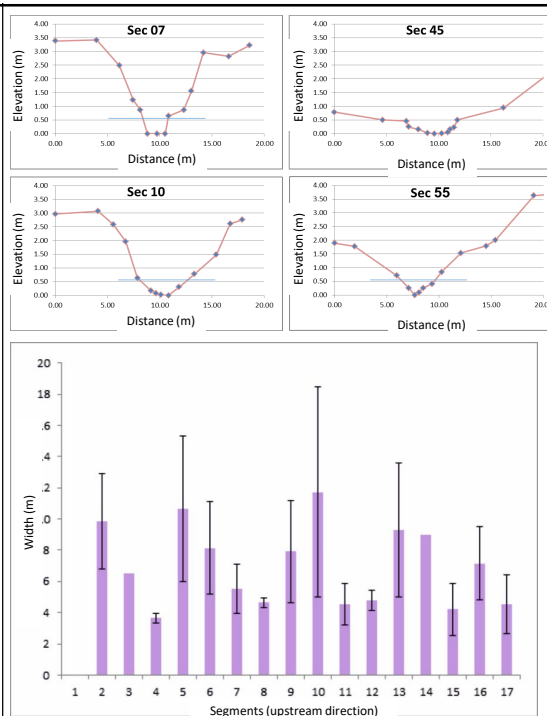

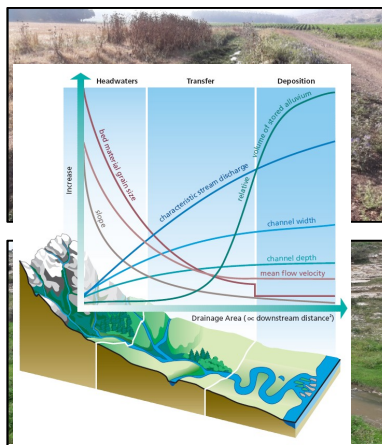

MQI - Parameters

- Stream channel pattern
- Stream sinuosity
- Altering sediment transport regime

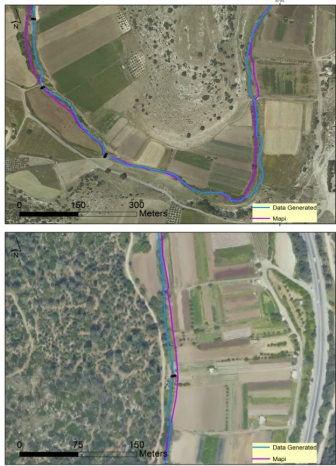

MQI - Parameters

- Stream cross sections
- Channel incision
- Lateral connectivity

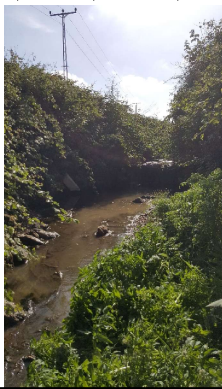

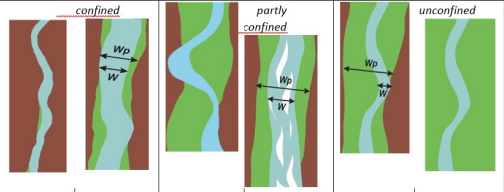

MQI - Parameters

- Stream confinement
- Stream-Floodplain coupling

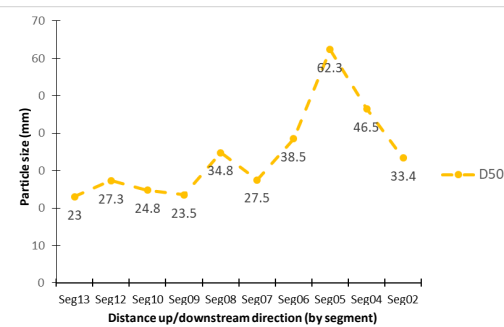

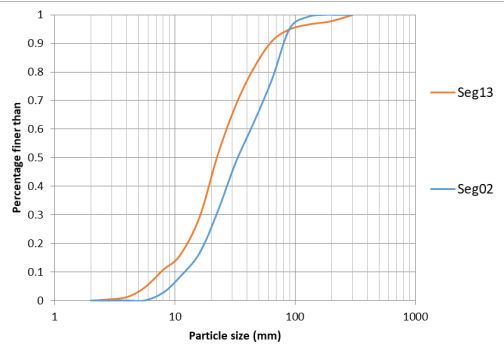

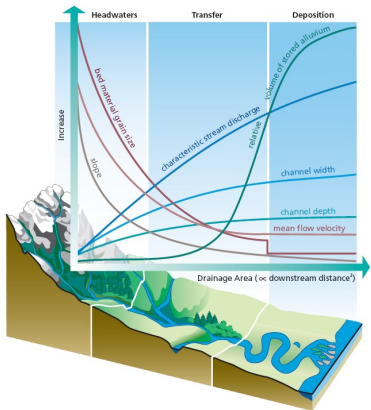

Confinement class	Description
Confined	All cases with confinement degree > 90%
	Confinement degree from 10% to 90% and confinement index ≤ 1.5
Partly confined	Confinement degree from 10% to 90% and confinement index > 1.5
	Confinement degree ≤ 10% and confinement index ≤ n
Unconfined	Confinement degree ≤ 10% and confinement index > n

Segment	Sinuosity Index	Confinement Index
1	1	-
2	1.4	103.3
3	1.1	80.8
4	1.7	212.6
5	6.4	109.1
6	1.2	48
7	1.3	76.3
8	1.1	102.2
9	1.4	58.9
10	1.3	27.2
11	1	46.3
12	1.2	46.2
13	1.1	51.1
14	1.2	105.7
15	1.2	53.7
16	1.1	39.7
17	1	29.3

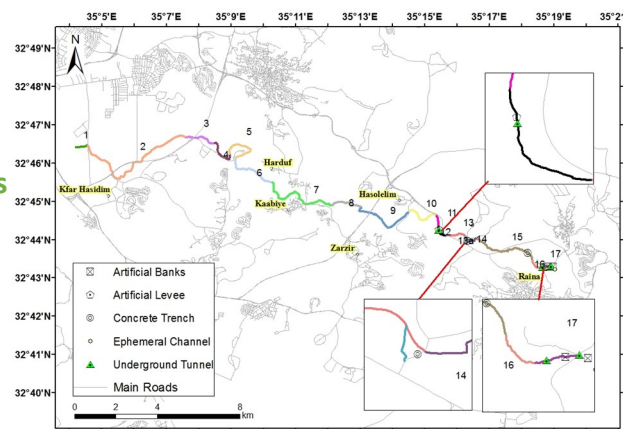

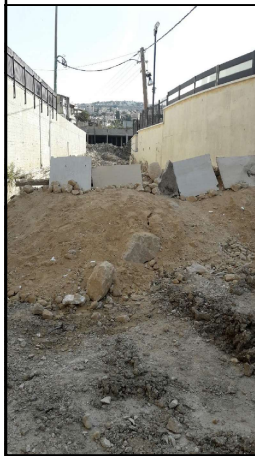

MQI - Parameters

- Bed material
- Downstream fining

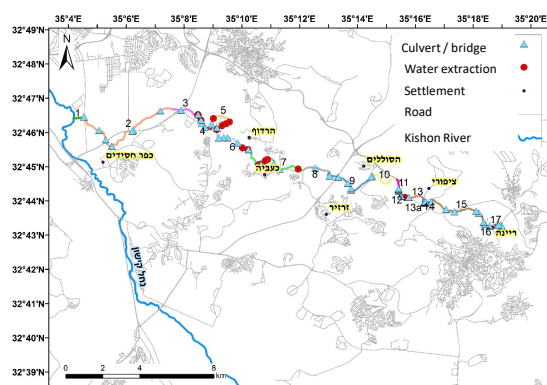

MQI - Parameters

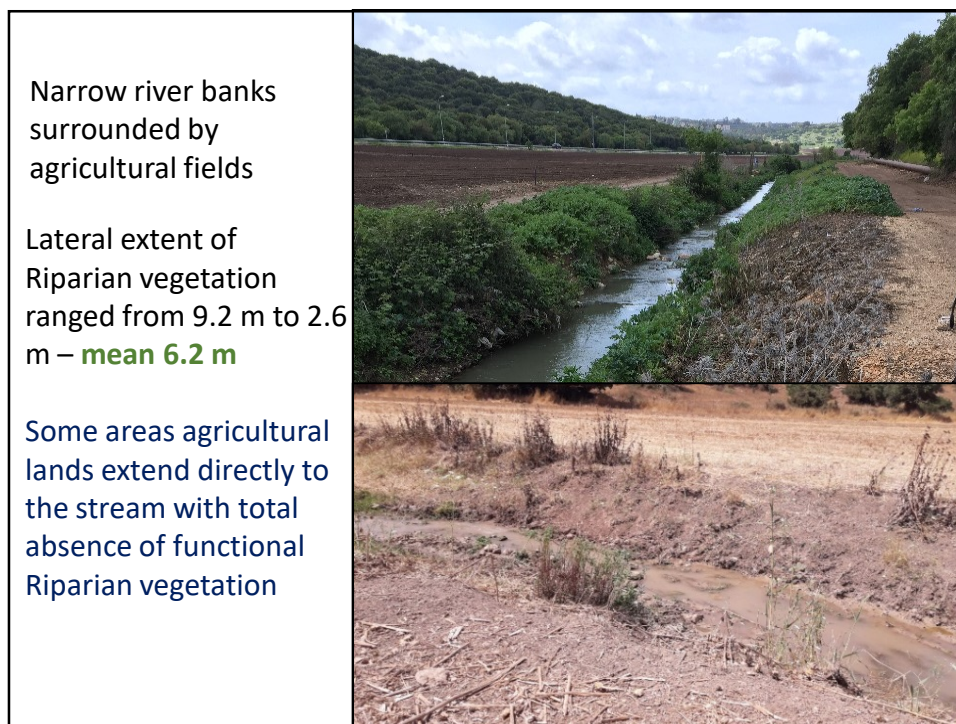

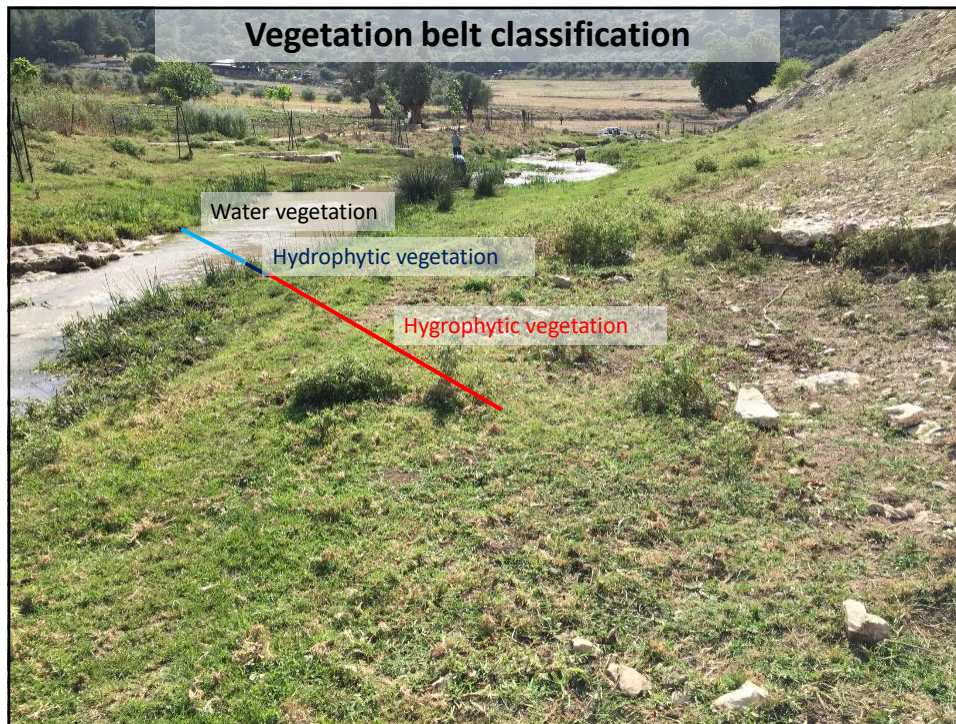

- Artificial structures
- Artificial bed & banks

MQI - Parameters

- Hydraulic constraints
- Discontinuity of water & sediment flux

Riparian vegetation dominated by *Rubus sancta* and *Phragmites australis*.

Monotypic species dominance – Mean species richness per transect range from 2 to 5.2 species

Rubus sancta - 32% cover along the stream

58 plant species limited to a cover of 3%

Expanding MQI with an ecological metric

Cattle grazing along and inside the stream

Highly degraded riparian vegetation dominated by ruderal species

Water quality degradation

Goats grazing along the stream

Shepherds remove locks on fenced restored vegetation areas

Conclusions

Focus on the geomorphological resulted overall in "good value"

Good tool – consistent approach / methodology for comparing / assessing coastal perennial streams

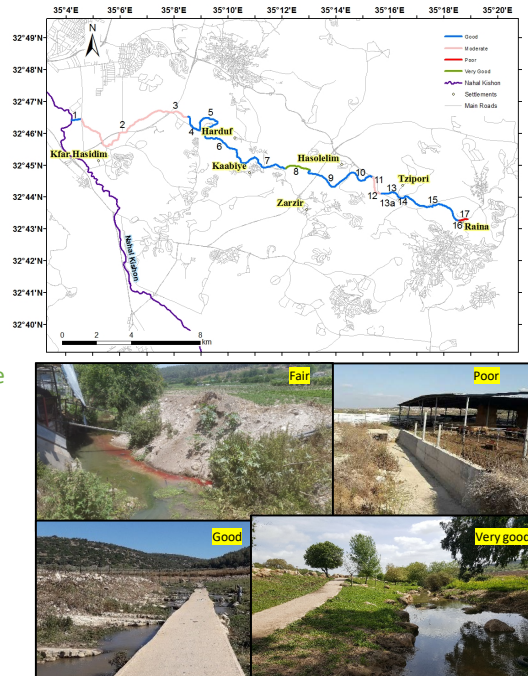

Riparian zone degraded, low ecological value

MQI applicable but limited. Provides consistent methodology but needs more holistic metrics

Future work needs to customizing the protocol for agricultural watersheds

Biophysical dysfunctional system

Guiding Intervention actions in Tzipori Stream
